Abstract—This one-page document confirms that the IEEEtran conference class compiles to a real two-column PDF with the local toolchain. It exercises the abstract, a table, and inline mathematics such as the confidence margin threshold τ and a symbol ϕ , plus a display equation.

Index Terms—IEEEtran, toolchain, tectonic, two-column

I. Introduction

This is column one of a two-column IEEE conference layout. If you can read this text flowing into a second column on the same page, the dual-column format is working. The gate escalates to the strong model whenever the margin falls below the threshold τ , i.e. $m < \tau$. A companion symbol ϕ is used below in a display equation to confirm math-mode rendering across both inline and display contexts. Lorem ipsum filler is added so the text is long enough to wrap from the first column into the second one and demonstrate the balanced two-column body.

A. A Display Equation

$$\phi(\tau) = \sum_{i=1}^N \mathbb{I}[m_i < \tau] \cdot c_i, \quad (1)$$

where c_i is the per-sample cost and m_i the confidence margin.

II. A Table

Table I shows a minimal booktabs table rendered inside the IEEE column.

III. Conclusion

If this PDF has two columns, a title block, an abstract, a table, and the symbols τ and ϕ render correctly, the IEEEtran build path is verified end to end.
